

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENTAMENDMENTS TO THE CLAIMS

Please substitute the following pending claims 1-17, 19-27, 29-183 and 186-190 as replacement claims for the previously-pending claims. In this Amendment D, claims 1, 2, 4-7, 15-17, 19-21, 25-27, 29, 64, 68, 72, 76, 80, 84, 88-94, 98, 102, 106, 110, 114, 118, 122, 126, 130, 134, 138, 142-148, 152, 156, 160, 164, 168, 172-174, 177, 178 and 186 are amended and claims 18 and 28 are canceled.

1. (currently amended) A parallel flow reaction system for effecting four or more simultaneous reactions in four or more reaction channels, the reaction system comprising  
four or more reactors, each of the four or more reactors comprising a surface defining a reaction cavity for carrying out a chemical reaction, an inlet port in fluid communication with the reaction cavity, and an outlet port in fluid communication with the reaction cavity,

a fluid distribution system for simultaneously supplying one or more reactants from one or more reactant sources to the inlet port of the reaction cavity for each of the four or more reactors, and for discharging a reactor effluent from the outlet port of each such reaction cavity to one or more effluent sinks, the fluid distribution system comprising one or more subsystems selected from the group consisting of

(a) a flow-partitioning subsystem for providing a different flow rate to each of the four or more reactors, the flow-partitioning subsystem comprising at least one set of four or more passive inlet or outlet flow restrictors, wherein each reactor of the four or more reactors is in fluid communication with at least one different passive flow restrictor from the set of four or more passive inlet or outlet flow restrictors than the other reactors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set,

(b) a pressure-partitioning subsystem for providing a different reaction pressure in the reaction cavity of each of the four or more reactors, the pressure-partitioning subsystem comprising at least one set of four or more passive inlet or outlet flow restrictors, wherein each reactor of the four or more reactors is in fluid communication with at least one different passive flow restrictor from the set of four or more passive inlet or outlet flow restrictors than the other

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

reactors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set, and

(c) a feed-composition subsystem for providing a different feed composition to each of the four or more reactors, the feed-composition subsystem comprising four or more mixing zones, each mixing zone in fluid communication with an inlet port of a different reactor of the four or more reactors and at least one two sets of four or more passive flow restrictors, a first of the two sets of passive flow restrictors in fluid communication with a first reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the first reactant source through at least one passive flow restrictor of the first set of flow restrictors, a second of the two sets of passive flow restrictors in fluid communication with a second reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the second reactant source through at least one passive flow restrictor of the second set of flow restrictors, each of the four or more flow restrictors in a set providing a resistance to flow between the or more reactant sources and one of the four or more mixing zones, each of the four or more flow restrictors in a set having a flow resistance that varies relative to other flow restrictors in the set.

2. (currently amended) A parallel flow reaction system for effecting four or more simultaneous reactions in four or more reaction channels, the reaction system comprising

four or more reactors, each of the four or more reactors comprising a surface defining a reaction cavity having a volume of not more than about 100 ml for carrying out a chemical reaction, an inlet port in fluid communication with the reaction cavity, and an outlet port in fluid communication with the reaction cavity, and

a fluid distribution system for simultaneously supplying one or more reactants from one or more reactant sources to the inlet port of the reaction cavity for each of the four or more reactors, and for discharging a reactor effluent from the outlet port of each such reaction cavity to one or more effluent sinks, the fluid distribution system comprising one or more subsystems selected from the group consisting of

(a) a flow-partitioning subsystem having operational capability for providing a different flow rate to each of the four or more reactors, the flow-partitioning subsystem comprising at

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

least one set of four or more flow restrictors integral with a substrate or with one or more microchip bodies mounted on a substrate, wherein each reactor of the four or more reactors is in fluid communication with at least one different flow restrictor from the set of four or more flow restrictors than the other reactors.

(b) a pressure-partitioning subsystem having operational capability for providing a different reaction pressure in the reaction cavity of each of the four or more reactors, the pressure-partitioning subsystem comprising at least one set of four or more flow restrictors integral with a substrate or with one or more microchip bodies mounted on a substrate, wherein each reactor of the four or more reactors is in fluid communication with at least one different flow restrictor from the set of four or more flow restrictors than the other reactors, and

(c) a feed-composition subsystem for having operational capability providing a different feed composition to each of the four or more reactors, the feed-composition subsystem comprising four or more mixing zones, each mixing zone in fluid communication with an inlet port of a different reactor of the four or more reactors and at least one two sets of four or more flow restrictors, a first of the two sets of flow restrictors in fluid communication with a first reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the first reactant source through at least one flow restrictor of the first set of flow restrictors, a second of the two sets of flow restrictors in fluid communication with a second reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the second reactant source through at least one flow restrictor of the second set of flow restrictors, each of the four or more flow restrictors in a set providing a resistance to flow between the or more reactant sources and one of the four or more mixing zones, the four or more flow restrictors being integral with a substrate or with one or more microchip bodies mounted on a substrate.

3. **(original)** The reaction system of claim 1 or 2 further comprising a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

4. **(currently amended)** The reaction systems of claims 1 or 2 wherein when the fluid distribution system comprises a flow-partitioning subsystem or a pressure-partitioning subsystem, the flow restrictors are four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one reactant source and one of the four or more reactors, each of the four or more inlet flow restrictors having a flow resistance that varies relative to other inlet flow restrictors in the set, and when the fluid distribution system comprises a feed-composition subsystem, the fluid distribution system further comprises a set of four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one reactant source and one of the four or more reactors, each of the four or more inlet flow restrictors having a flow resistance that varies relative to other inlet flow restrictors in the set.

5. **(currently amended)** The reaction systems of claims 1 or 2 wherein when the fluid distribution system comprises a flow-partitioning subsystem or a pressure-partitioning subsystem, the flow restrictors are four or more outlet flow restrictors, each of the four or more outlet flow restrictors providing fluid communication between one of the four or more reactors and at least one effluent sink, each of the four or more outlet flow restrictors having a flow resistance that varies relative to other outlet flow restrictors in the set, and when the fluid distribution system comprises a feed-composition subsystem, the fluid distribution system further comprises a set of four or more outlet flow restrictors, each of the four or more outlet flow restrictors providing fluid communication between one of the four or more reactors and at least one effluent sink, each of the four or more outlet flow restrictors having a flow resistance that varies relative to other outlet flow restrictors in the set.

6. **(currently amended)** The reaction systems of claims 1 or 2 wherein when the fluid distribution system further comprises a flow-partitioning subsystem or a pressure-partitioning subsystem, the flow restrictors are

a first set of four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one reactant source and one of the four or more reactors, each of the four or more inlet flow restrictors having a flow resistance that varies relative to other inlet flow restrictors in the set, and when the fluid distribution

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

system comprises a feed-composition subsystem, the fluid distribution system further comprises a first set of four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one reactant source and one of the four or more reactors, each of the four or more inlet flow restrictors having a flow resistance that varies relative to other inlet flow restrictors in the set, the fluid distribution further comprising and

a second set of four or more outlet flow restrictors, each of the four or more outlet flow restrictors providing fluid communication between one of the four or more reactors and at least one effluent sink, each of the four or more outlet flow restrictors having a flow resistance that varies relative to other outlet flow restrictors in the set.

7. (currently amended) A parallel flow reaction system for effecting four or more simultaneous reactions in four or more reaction channels, the reaction system comprising

four or more reactors, each of the four or more reactors comprising a surface defining a reaction cavity for carrying out a chemical reaction, an inlet port in fluid communication with the reaction cavity, and an outlet port in fluid communication with the reaction cavity, and

a fluid distribution system for simultaneously supplying one or more reactants from one or more reactant sources to the inlet port of the reaction cavity for each of the four or more reactors, and for discharging a reactor effluent from the outlet port of each such reaction cavity to one or more effluent sinks, the fluid distribution system comprising a flow-partitioning subsystem for providing a different flow rate to each of the four or more reactors, the flow-partitioning subsystem comprising at least one set of four or more passive inlet or outlet flow restrictors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set wherein each reactor of the four or more reactors is in fluid communication with at least one different flow restrictor from the set of four or more flow restrictors than the other reactors.

8. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem and the pressure-partitioning subsystem.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

9. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem and the feed-composition subsystem.

10. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

11. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem, the pressure-partitioning subsystem and the feed-composition subsystem.

12. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem, the pressure-partitioning subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

13. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem, the feed-composition subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

14. (original) The reaction system of claim 1 comprising the flow-partitioning subsystem, the pressure-partitioning subsystem, the feed-composition subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

15. (currently amended) The reaction system of claim 7 wherein the flow restrictors of the flow-partitioning subsystem comprises are a set of four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one

Application Serial No. 09/801,390

PATENT

a second set of four or more outlet flow restrictors, each of the four or more outlet flow restrictors providing fluid communication between one of the four or more reactors and at least one effluent sink, each of the four or more outlet flow restrictors having a flow resistance,  $R_{\text{outlet}}$ , that varies relative to other outlet flow restrictors in the set,

the total resistance of the inlet and outlet flow restrictors for each channel,  $R_{\text{total}} = R_{\text{inlet}} + R_{\text{outlet}}$ , varying between each of the four or more channels of the reaction system to provide a different flowrate through each of the four or more reactors, and the ratio of the resistances of the inlet and outlet flow restrictors for each channel,  $R_{\text{inlet}} : R_{\text{outlet}}$ , being substantially the same between each of the four or more channels of the reaction system to provide substantially the same pressure in the reaction cavities of each of the four or more reactors.

20. (currently amended) The reaction system of claim 8 wherein the flow-partitioning subsystem and the pressure-partitioning subsystem are integrated and the flow restrictors are comprise

a first set of four or more inlet flow restrictors, each of the four or more inlet flow restrictors providing fluid communication between at least one reactant source and one of the four or more reactors, each of the four or more inlet flow restrictors having a flow resistance,  $R_{\text{inlet}}$ , that varies relative to other inlet flow restrictors in the set, the fluid distribution system further comprising and

a second set of four or more outlet flow restrictors, each of the four or more outlet flow restrictors providing fluid communication between one of the four or more reactors and at least one effluent sink, each of the four or more outlet flow restrictors having a flow resistance,  $R_{\text{outlet}}$ , that varies relative to other outlet flow restrictors in the set,

the total resistance of the inlet and outlet flow restrictors for each channel,  $R_{\text{total}} = R_{\text{inlet}} + R_{\text{outlet}}$ , varying between each of the four or more channels of the reaction system to provide different flow rates through each of the four or more reactors, and the ratio of the resistances of the inlet and outlet flow restrictors for each channel,  $R_{\text{inlet}} : R_{\text{outlet}}$ , varying between each of the four or more channels of the reaction system to provide a different pressure in the reaction cavities of each of the four or more reactors.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

21. **(currently amended)** A parallel flow reaction system for effecting four or more simultaneous reactions in four or more reaction channels, the reaction system comprising
- four or more reactors, each of the four or more reactors comprising a surface defining a reaction cavity for carrying out a chemical reaction, an inlet port in fluid communication with the reaction cavity, and an outlet port in fluid communication with the reaction cavity, and
- a fluid distribution system for simultaneously supplying one or more reactants from one or more reactant sources to the inlet port of the reaction cavity for each of the four or more reactors, and for discharging a reactor effluent from the outlet port of each such reaction cavity to one or more effluent sinks, the fluid distribution system comprising a pressure-partitioning subsystem for providing a different reaction pressure in the reaction cavity of each of the four or more reactors, the pressure-partitioning subsystem comprising at least one set of four or more passive inlet or outlet flow restrictors, wherein each reactor of the four or more reactors is in fluid communication with at least one different passive flow restrictor from the set of four or more passive inlet or outlet flow restrictors than the other reactors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set.
22. **(original)** The reaction system of claim 1 comprising the pressure-partitioning subsystem and the feed-composition subsystem.
23. **(original)** The reaction system of claim 1 comprising the pressure-partitioning subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.
24. **(original)** The reaction system of claim 1 comprising the pressure-partitioning subsystem, the feed-composition subsystem and a temperature-control subsystem having operational capability for providing a different reaction temperature in the reaction cavity of each of the four or more reactors.

Application Serial No. 09/801,390

72. **(currently amended)** The reaction system of claim 17 wherein the flow-partitioning subsystem comprises

a first plurality of selectable dedicated inlet flow restrictors having different flow resistances, and providing selectable fluid communication between the at least one reactant source and a first reactor of the four or more reactors,

a second plurality of selectable dedicated inlet flow restrictors having different flow resistances, and providing selectable fluid communication between the at least one reactant source and a second reactor of the four or more reactors,

a third plurality of selectable dedicated inlet flow restrictors having different flow resistances, and providing selectable fluid communication between the at least one reactant source and a third reactor of the four or more reactors, and

a fourth plurality of selectable dedicated inlet flow restrictors having different flow resistances, and providing selectable fluid communication between the at least one reactant source and a fourth reactor of the four or more reactors, and

a first means for selecting at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors to form the set of four or more inlet flow restrictors

~~such that the set of four or more inlet flow restrictors can be selected to include at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors, and further,~~

a first plurality of selectable dedicated outlet flow restrictors having different flow resistances, and providing selectable fluid communication between the first reactor and the at least one effluent sink,

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

a second plurality of selectable dedicated outlet flow restrictors having different flow resistances, and providing selectable fluid communication between the second reactor and the at least one effluent sink,

a third plurality of selectable dedicated outlet flow restrictors having different flow resistances, and providing selectable fluid communication between the third reactor and the at least one effluent sink, and

a fourth plurality of selectable dedicated outlet flow restrictors having different flow resistances, and providing selectable fluid communication between the fourth reactor and the at least one effluent sink, and

a second means for selecting at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated outlet flow restrictors to form the set of four or more outlet flow restrictors

~~such that the set of four or more outlet flow restrictors can be selected to include at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated outlet flow restrictors.~~

73. (original) The reaction system of claim 72 wherein

the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on the substrate, and

the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated outlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

74. **(original)** The reaction system of claim 72 wherein  
the first plurality, the second plurality, the third plurality and the fourth plurality of  
selectable dedicated inlet flow restrictors are integral with one or more microchip bodies  
mounted on a substrate, and  
the first plurality, the second plurality, the third plurality and the fourth plurality of  
selectable dedicated outlet flow restrictors are integral with one or more microchip bodies  
mounted on a substrate.

75. **(original)** The reaction system of claim 72 wherein  
the first plurality, the second plurality, the third plurality and the fourth plurality of  
selectable dedicated inlet flow restrictors are integral with one or more microchip bodies  
detachably mounted on the substrate, and  
the first plurality, the second plurality, the third plurality and the fourth plurality of  
selectable dedicated outlet flow restrictors are integral with one or more microchip bodies  
detachably mounted on the substrate.

76. **(currently amended)** The reaction system of claim 25 wherein the pressure-  
partitioning subsystem comprises  
a first plurality of selectable dedicated inlet flow restrictors having different flow  
resistances, and providing selectable fluid communication between the at least one reactant  
source and a first reactor of the four or more reactors,  
a second plurality of selectable dedicated inlet flow restrictors having different flow  
resistances, and providing selectable fluid communication between the at least one reactant  
source and a second reactor of the four or more reactors,  
a third plurality of selectable dedicated inlet flow restrictors having different flow  
resistances, and providing selectable fluid communication between the at least one reactant  
source and a third reactor of the four or more reactors, and

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

a fourth plurality of selectable dedicated inlet flow restrictors having different flow resistances, and providing selectable fluid communication between the at least one reactant source and a fourth reactor of the four or more reactors, and

a means for selecting at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors to form the set of four or more inlet flow restrictors

~~such that the set of four or more inlet flow restrictors can be selected to include at least one flow restrictor from each of the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors.~~

77. (original) The reaction system of claim 76 wherein the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

78. (original) The reaction system of claim 76 wherein the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors are integral with one or more microchip bodies mounted on a substrate.

79. (original) The reaction system of claim 76 wherein the first plurality, the second plurality, the third plurality and the fourth plurality of selectable dedicated inlet flow restrictors are integral with one or more microchip bodies detachably mounted on a substrate.

80. (currently amended) The reaction system of claim 26 wherein the pressure-partitioning subsystem comprises

a first plurality of selectable dedicated outlet flow restrictors having different flow resistances, and providing selectable fluid communication between a first reactor of the four or more reactors and the at least one effluent sink,

Application Serial No. 09/801,390

PATENT

restrictors providing fluid communication between at least one reactant source and first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the first set having a different flow resistance relative to each other, and (b) a second set of four or more inlet flow restrictors comprising first, second, third and fourth inlet flow restrictors providing fluid communication between the least one reactant source and the first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more inlet flow restrictors of the second set varying from the flow resistance of the corresponding inlet flow restrictor of the first set, and (c) a first means for selecting such that the first set or the second set of inlet flow restrictors can be selected to provide fluid communication between the at least one reactant source and the four or more reactors, and

a series of selectable sets of outlet flow restrictors, the outlet-set series comprising (a) a first set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between first, second, third and fourth reactors, respectively, and at least one effluent sink, each of the first, second, third and fourth outlet flow restrictors of the first set having a different flow resistance relative to each other, and (b) a second set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between the first, second, third and fourth reactors, respectively, and the at least one effluent sink, each of the first, second, third and fourth outlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more outlet flow restrictors of the second set varying from the flow resistance of the corresponding outlet flow restrictor of the first set, and (c) a second means for selecting such that the first set or the second set of outlet flow restrictors can be selected to provide fluid communication between the four or more reactors and the at least one effluent sink.

127. (original) The reaction system of claim 126 wherein

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

128. **(original)** The reaction system of claim 126 wherein

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies mounted on a substrate.

129. **(previously presented)** The reaction system of claim 126 wherein

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies detachably mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies detachably mounted on a substrate.

130. **(currently amended)** The reaction system of claim 25 wherein the pressure-partitioning subsystem comprises a series of selectable sets of inlet flow restrictors, the series comprising

a first set of four or more inlet flow restrictors comprising first, second, third and fourth inlet flow restrictors providing fluid communication between at least one reactant source and first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the first set having a different flow resistance relative to each other, and

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

a second set of four or more inlet flow restrictors comprising first, second, third and fourth inlet flow restrictors providing fluid communication between the least one reactant source and the first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more inlet flow restrictors of the second set varying from the flow resistance of the corresponding inlet flow restrictor of the first set, and

a means for selecting ~~such that~~ the first set or the second set of inlet flow restrictors ~~can be selected to~~ provide fluid communication between the at least one reactant source and the four or more reactors.

131. (original) The reaction system of claim 130 wherein the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

132. (original) The reaction system of claim 130 wherein the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies mounted on a substrate.

133. (original) The reaction system of claim 130 wherein the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies detachably mounted on a substrate.

134. (currently amended) The reaction system of claim 26 wherein the pressure-partitioning subsystem comprises a series of selectable sets of outlet flow restrictors, the series comprising

a first set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between first, second, third and fourth reactors, respectively, and at least one effluent sink, each of the first, second, third and fourth

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

outlet flow restrictors of the first set having a different flow resistance relative to each other,  
and

a second set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between the first, second, third and fourth reactors, respectively, and the at least one effluent sink, each of the first, second, third and fourth outlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more outlet flow restrictors of the second set varying from the flow resistance of the corresponding outlet flow restrictor of the first set, and

a means for selecting ~~such that~~ the first set or the second set of outlet flow restrictors ~~can be selected~~ to provide fluid communication between the four or more reactors and the at least one effluent sink

135. **(original)** The reaction system of claim 134 wherein the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

136. **(original)** The reaction system of claim 134 wherein the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies mounted on a substrate.

137. **(original)** The reaction system of claim 134 wherein the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies detachably mounted on a substrate.

138. **(currently amended)** The reaction system of claim 27 wherein the pressure-partitioning subsystem comprises

a series of selectable sets of inlet flow restrictors, the series comprising (a) a first set of four or more inlet flow restrictors comprising first, second, third and fourth inlet flow

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

restrictors providing fluid communication between at least one reactant source and first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the first set having a different flow resistance relative to each other, ~~and~~ (b) a second set of four or more inlet flow restrictors comprising first, second, third and fourth inlet flow restrictors providing fluid communication between the least one reactant source and the first, second, third and fourth reactors, respectively, each of the first, second, third and fourth inlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more inlet flow restrictors of the second set varying from the flow resistance of the corresponding inlet flow restrictor of the first set, and (c) a first means for selecting such that the first set or the second set of inlet flow restrictors can be selected to provide fluid communication between the at least one reactant source and the four or more reactors, and

a series of selectable sets of outlet flow restrictors, the series comprising (a) a first set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between first, second, third and fourth reactors, respectively, and at least one effluent sink, each of the first, second, third and fourth outlet flow restrictors of the first set having a different flow resistance relative to each other, ~~and~~ (b) a second set of four or more outlet flow restrictors comprising first, second, third and fourth outlet flow restrictors providing fluid communication between the first, second, third and fourth reactors, respectively, and the at least one effluent sink, each of the first, second, third and fourth outlet flow restrictors of the second set having a different flow resistance relative to each other, the flow resistance of at least one of the four or more outlet flow restrictors of the second set varying from the flow resistance of the corresponding outlet flow restrictor of the first set, and (c) a second means for selecting such that the first set or the second set of outlet flow restrictors can be selected to provide fluid communication between the four or more reactors and the at least one effluent sink.

139. (original) The reaction system of claim 138 wherein

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

140. **(original)** The reaction system of claim 138 wherein

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies mounted on a substrate.

141. **(previously presented)** The reaction system of claim 138 wherein

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with one or more microchip bodies detachably mounted on the substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors are integral with one or more microchip bodies detachably mounted on the substrate.

142. **(currently amended)** The reaction system of claim 118 wherein the selection means~~flow partitioning subsystem further~~ comprises an inlet selection valve for selecting at least one the first set of inlet flow restrictors or the second set of inlet flow restrictors.

143. **(currently amended)** The reaction system of claim 122 wherein the selection means~~flow partitioning subsystem further~~ comprises an outlet selection valve for selecting at least one the first set of outlet flow restrictors or the second set of outlet flow restrictors.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

144. (currently amended) The reaction system of claim 126 wherein the first selection means ~~flow-partitioning subsystem further comprises~~  
an inlet selection valve for selecting at least one the first set of inlet flow restrictors or the second set of inlet flow restrictors, and  
the second selection means comprises an outlet selection valve for selecting at least one the first set of outlet flow restrictors or the second set of outlet flow restrictors.

145. (currently amended) The reaction system of claim 130 wherein the selection means ~~pressure-partitioning subsystem further comprises~~ an inlet selection valve for selecting at least one the first set of inlet flow restrictors or the second set of inlet flow restrictors.

146. (currently amended) The reaction system of claim 134 wherein the selection means ~~pressure-partitioning subsystem further comprises~~ an outlet selection valve for selecting at least one the first set of outlet flow restrictors or the second set of outlet flow restrictors.

147. (currently amended) The reaction system of claim 138 wherein the first selection means ~~pressure-partitioning subsystem further comprises~~  
an inlet selection valve for selecting at least one the first set of inlet flow restrictors or the second set of inlet flow restrictors, and  
the second selection means comprises an outlet selection valve for selecting at least one the first set of outlet flow restrictors or the second set of outlet flow restrictors.

148. (currently amended) The reaction system of claim 118 wherein the selection means ~~flow-partitioning subsystem further comprises~~ a series of inlet isolation valves, the inlet-isolation-valve series comprising a first inlet isolation valve for selecting the first set of inlet flow restrictors, and a second inlet isolation valve for selecting the second set of inlet flow restrictors.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

149. (original) The reaction system of claim 148 wherein the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

150. (original) The reaction system of claim 148 wherein the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

151. (original) The reaction system of claim 148 wherein  
the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set array are integral with a substrate or with one or more microchip bodies mounted on a substrate.

152. (currently amended) The reaction system of claim 122 wherein the selection means ~~flow-partitioning subsystem further~~ comprises a series of outlet isolation valves, the outlet-isolation valve series comprising a first outlet isolation valve for selecting the first set of outlet flow restrictors, and a second outlet isolation valve for selecting the second set of outlet flow restrictors.

153. (original) The reaction system of claim 152 wherein the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

154. (original) The reaction system of claim 152 wherein the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

155. **(original)** The reaction system of claim 152 wherein

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors are integral with a substrate or with one or microchip bodies mounted on a substrate.

156. **(currently amended)** The reaction system of claim 126 wherein the first selection ~~means flow partitioning subsystem further comprises~~

a series of inlet isolation valves, the inlet-valve series comprising a first inlet isolation valve for selecting the first set of inlet flow restrictors, and a second inlet isolation valve for selecting the second set of inlet flow restrictors, and

the second selection means comprises a series of outlet isolation valves, the outlet-valve series comprising a first outlet isolation valve for selecting the first set of outlet flow restrictors, and a second outlet isolation valve for selecting the second set of outlet flow restrictors.

157. **(previously presented)** The reaction system of claim 156 wherein

the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

158. **(original)** The reaction system of claim 156 wherein

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

159. **(original)** The reaction system of claim 156 wherein

the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate,

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate,

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set array are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

160. **(currently amended)** The reaction system of claim 130 wherein the selection means~~pressure partitioning subsystem~~ further comprises a series of inlet isolation valves, the inlet-isolation valve series comprising a first inlet isolation valve for selecting the first set of inlet flow restrictors, and a second inlet isolation valve for selecting the second set of inlet flow restrictors.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

161. **(original)** The reaction system of claim 160 wherein the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

162. **(original)** The reaction system of claim 160 wherein the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

163. **(original)** The reaction system of claim 160 wherein  
the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set array are integral with a substrate or with one or more microchip bodies mounted on a substrate.

164. **(currently amended)** The reaction system of claim 134 wherein the selection  
~~means pressure partitioning subsystem further~~ comprises a series of outlet isolation valves, the outlet-valve series comprising a first outlet isolation valve for selecting the first set of outlet flow restrictors, and a second outlet isolation valve for selecting the second set of outlet flow restrictors.

165. **(original)** The reaction system of claim 164 wherein the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

166. **(original)** The reaction system of claim 164 wherein the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

167. **(original)** The reaction system of claim 164 wherein

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

168. **(currently amended)** The reaction system of claim 138 wherein the ~~pressure-partitioning subsystem further~~ first selection means comprises

a series of inlet isolation valves, the inlet-valve series comprising a first inlet isolation valve for selecting the first set of inlet flow restrictors, and a second inlet isolation valve for selecting the second set of inlet flow restrictors, and

the second selection means comprises a series of outlet isolation valves, the outlet-valve series comprising a first outlet isolation valve for selecting the first set of outlet flow restrictors, and a second outlet isolation valve for selecting the second set of outlet flow restrictors.

169. **(previously presented)** The reaction system of claim 168 wherein

the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

170. **(original)** The reaction system of claim 168 wherein

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

171. (original) The reaction system of claim 168 wherein

the first inlet isolation valve and the second inlet isolation valve of the inlet-isolation valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate,

the first outlet isolation valve and the second outlet isolation valve of the outlet-isolation-valve series are integral with a substrate or with one or more microchip bodies mounted on a substrate,

the first set of four or more inlet flow restrictors and the second set of four or more inlet flow restrictors of the inlet-set array are integral with a substrate or with one or more microchip bodies mounted on a substrate, and

the first set of four or more outlet flow restrictors and the second set of four or more outlet flow restrictors of the outlet-set series are integral with a substrate or with one or more microchip bodies mounted on a substrate.

172. (currently amended) The reaction system of claims 1 or 2 further comprising a detection system in fluid communication with the outle ports of the four or more reactors for detecting at least one reaction product or unreacted reactant from the effluent discharged from each of the four or more reactors.

173. (currently amended) The reaction system of claims 1 or 2 further comprising a parallel detection system in fluid communication with the outle ports of the four or more reactors

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

for simultaneously detecting at least one reaction product or unreacted reactant from the effluent discharged from each of the four or more reactors.

174. **(currently amended)** The reaction system of claims 1 or 2 further comprising a parallel gas chromatograph in fluid communication with the outlet ports of the four or more reactors for simultaneously detecting at least one reaction product or unreacted reactant from the effluent discharged from each of the four or more reactors.

175. **(previously presented)** The reaction system of claim 1 wherein the reaction cavity of each of the four or more reactors has a volume of not more than about 10 ml.

176. **(previously presented)** The reaction system of claim 1 wherein the reactors and fluid distribution system are adapted to effect a chemical reaction of interest at a temperature of not less than about 100 °C and additionally, or alternatively, at a pressure of not less than about 10 bar.

177. **(currently amended)** A method for evaluating a chemical reaction process, the method comprising

simultaneously supplying one or more reactants to each of four or more reactors under reaction conditions to effect a chemical reaction of interest, the one or more reactants being supplied through a fluid distribution system,

controllably varying a first set of reaction conditions between the four or more reactors, the first set of reaction conditions being selected from flow rate, pressure and feed composition, and

discharging a reactor effluent from each of the four or more reactors,

the fluid distribution system comprising one or more subsystems selected from the group consisting of

a flow-partitioning subsystem for providing a different flow rate to each of the four or more reactors, the flow-partitioning subsystem comprising at least one set of four or more

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

passive inlet or outlet flow restrictors, wherein each reactor of the four or more reactors is in fluid communication with at least one different passive flow restrictor from the set of four or more passive inlet or outlet flow restrictors than the other reactors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set,

a pressure-partitioning subsystem for providing a different reaction pressure in the reaction cavity of each of the four or more reactors, the pressure-partitioning subsystem comprising at least one set of four or more passive inlet or outlet flow restrictors, wherein each reactor of the four or more reactors is in fluid communication with at least one different passive flow restrictor from the set of four or more passive inlet or outlet flow restrictors than the other reactors, each of the four or more inlet or outlet flow restrictors having a flow resistance that varies relative to other flow restrictors in the set, and

a feed-composition subsystem for providing a different feed composition to each of the four or more reactors, the feed-composition subsystem comprising four or more mixing zones, each mixing zone in fluid communication with an inlet port of a different reactor of the four or more reactors and at least one two sets of four or more passive flow restrictors, a first of the two sets of passive flow restrictors in fluid communication with a first reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the first reactant source through at least one passive flow restrictor of the first set of flow restrictors, a second of the two sets of passive flow restrictors in fluid communication with a second reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the second reactant source through at least one passive flow restrictor of the second set of flow restrictors, each of the four or more flow restrictors in a set providing a resistance to flow between the or more reactant sources and one of the four or more mixing zones, each of the four or more flow restrictors in a set having a flow resistance that varies relative to other flow restrictors in the set.

178. (currently amended) A method for evaluating a chemical reaction process, the method comprising

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

simultaneously supplying one or more reactants through a fluid distribution system to each of four or more reactors under reaction conditions to effect a chemical reaction of interest, each of the four or more reactors having a volume of not more than about 10 ml,

controllably varying a first set of reaction conditions between the four or more reactors, the first set of reaction conditions being selected from flow rate, pressure and feed composition, and

discharging a reactor effluent from each of the four or more reactors through the fluid distribution system,

the fluid distribution system comprising one or more subsystems selected from the group consisting of

a flow-partitioning subsystem having operational capability for providing a different flow rate to each of the four or more reactors, the flow-partitioning subsystem comprising at least one set of four or more flow restrictors integral with a substrate or with one or more microchip bodies mounted on a substrate, wherein each reactor of the four or more reactors is in fluid communication with at least one different flow restrictor from the set of four or more flow restrictors than the other reactors.

a pressure-partitioning subsystem having operational capability for providing a different reaction pressure in the reaction cavity of each of the four or more reactors, the pressure-partitioning subsystem comprising at least one set of four or more flow restrictors integral with a substrate or with one or more microchip bodies mounted on a substrate, wherein each reactor of the four or more reactors is in fluid communication with at least one different flow restrictor from the set of four or more flow restrictors than the other reactors. and

a feed-composition subsystem for having operational capability providing a different feed composition to each of the four or more reactors, the feed-composition subsystem comprising four or more mixing zones, each mixing zone in fluid communication with an inlet port of a different reactor of the four or more reactors and at least one two sets of four or more flow restrictors, a first of the two sets of flow restrictors in fluid communication with a first reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the first reactant source through at least one flow

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

restrictor of the first set of flow restrictors, a second of the two sets of flow restrictors in fluid communication with a second reactant source and the four or more mixing zones so that each of the four or more mixing zones is in fluid communication with the second reactant source through at least one flow restrictor of the second set of flow restrictors, each of the four or more flow restrictors in a set providing a resistance to flow between the or more reactant sources and one of the four or more mixing zones, the four or more flow restrictors being integral with a substrate or with one or more microchip bodies mounted on a substrate.

179. **(original)** The method of claims 177 or 178 further comprising controlling a second set of reaction conditions to be substantially the same in each of the four or more reactors.

180. **(original)** The method of claims 177 or 178 further comprising  
analyzing the reactor effluent from each of the four or more reactors to determine the conversion, selectivity or yield of the chemical reaction of interest, and  
comparing the determined conversion, selectivity or yield for the reactions effected in each of the four or more reactors.

181. **(previously presented)** The method of claim 180 wherein the reactor effluent from each of the four or more reactors are simultaneously analyzed.

182. **(previously presented)** The method of claim 180 wherein the reactor effluent from each of the four or more reactors are simultaneously analyzed using gas chromatography or mass spectrometry.

183. **(previously presented)** The method of claim 180 wherein the reactor effluent from each of the four or more reactors are simultaneously analyzed using gas chromatography.

184. **(canceled).**

PATENT

185. (canceled).

186. (currently amended) A system comprising

four or more cavities, each of the four or more cavities having an inlet providing fluid communication with at least one fluid source, and optionally, where each of the four or more cavities ~~cavity~~ is a flow cavity, an outlet providing fluid communication with at least one effluent sink, and

a fluid distribution system comprising

one or more subsystems selected from the group consisting of (a) a flow-partitioning subsystem for providing a different flow rate to each of the four or more cavities, (b) a pressure-partitioning subsystem for providing a different pressure in each of the four or more cavities, and (c) a feed-composition subsystem for providing a different feed composition to each of the four or more cavities, the one or more subsystems comprising at least one set of four or more flow restrictors, each of the four or more flow restrictors having a flow resistance that varies relative to other flow restrictors in the set, each of the four or more flow restrictors (i) being a capillary or (ii) being integral with a substrate or with one or more microchip bodies mounted on a substrate, wherein in the feed-composition subsystem, the at least one set of flow restrictors is a first set of flow restrictors in fluid communication with a first fluid source and the four or more cavities so that each of the four or more cavities is in fluid communication with the first fluid source through at least one flow restrictor of the first set of flow restrictors, the feed-composition subsystem further comprising a second set of four or more flow restrictors in fluid communication with a second fluid source and the four or more cavities so that each of the four or more cavities is in fluid communication with the second fluid source through at least one flow restrictor of the second set of flow restrictors, each of the second set of four or more flow restrictors (i) being a capillary or (ii) being integral with a substrate or with one or more microchip bodies mounted on a substrate.

187. (previously presented) The system of claim 186 wherein the four or more flow restrictors are integral with a substrate or with one or more microchip bodies mounted on a substrate.

Application Serial No. 09/801,390

Docket No. 2000-022R1  
PATENT

188. **(previously presented)** The system of claim 186 wherein the four or more flow restrictors are integral with a substrate or with one or more microchip bodies detachably mounted on a substrate.

189. **(previously presented)** The system of claim 186 wherein the cavity is a flow cavity and comprises the outlet in fluid communication with the at least one effluent sink.

190. **(previously presented)** The system of claim 186 wherein the cavity has a volume of not more than about 100 ml.

191. **(canceled)**
